

(Decomposition):

- setup function
- canvas size
- background color
- stroke color
- dimensions for the circles
- draw function uses a 5x5 grid to position circles by calling drawGrid

(Pattern Recognition):

- grid layout has each circle centered
- variations in size and stroke thickness

(Abstraction):

- stroke weight
- size adjusted to create unique visuals
- generate a new pattern

(Algorithm Design):

- Grid Drawing: determine each circle's position based
- **Circle Drawing**: drawGrid function 10 times to draw circles , each cell with random sizes
- random function creates variability
